

SLR Weight-Length Relation

Exercise - Nunavut

Answer the following questions by creating an R script and iteratively running the code in RStudio.

1. Load the `PG008_original.xlsx` file into a `data.frame` object and answer the following questions.
 - a. Fit an appropriate (i.e., assess the assumptions) weight-length relationship to these data.
 - b. What is the r^2 for the fitted relationship?
 - c. Provide a table of parameter estimates (and 95% confidence intervals) for the weight-length relationship regression.
 - d. Predict (with 95% prediction interval) the **weight** of a fish with a given length (i.e., choose a reasonable length)?
 - e. Provide summary graphics of the weight-length relationship regression on two scales (i.e., two graphics).

-
2. [*Time Permitting*] Repeat the above analyses for some other subset of Arctic Charr.
-
